The Pulmonary Circulation in Health and Disease

The Pulmonary Circulation in Health and Disease covers the proceedings of a symposium purposed to create a more complete picture of the pulmonary circulation under normal and diseased conditions through the help of an interdisciplinary group of acknowledged experts.

The book is divided into seven parts. The first part discusses morphology in relation to pulmonary circulation and includes an overview of the microscopic appearance of the pulmonary artery and the innervation of the pulmonary circulation, as well as the structure and infrastructure of the pulmonary microvasculature and the changes it undergoes. The second part concerns itself with the different pharmacological studies related to pulmonary circulation. The third part goes in-depth about concepts in pulmonary hemodynamics, such as its occlusion methods, its models based on anatomic and functional data, its active distribution, and gravity nondependent distribution of pulmonary blood flow; the fourth part on the other hand discusses pulmonary blood flow and gas exchange. The fifth part discusses pulmonary endothelial cells, its mechanisms, and its properties; the sixth and seventh parts cover the mechanisms of pulmonary hypertension.

The text is recommended for basic scientists studying the lung and for clinicians such as cardiologists and pulmonologists. Those interested in the effects of alterations in lung function will also find this helpful.
